Art Unit: 2124

#### **DETAILED ACTION**

1. Claims 1-15 have been examined.

## **Priority**

2. Acknowledgment is made of applicant's claim for foreign priority based on an application filed in the United Kingdom on 19 September 2000. It is noted, however, that applicant has not filed a certified copy of the 0022787.6 application as required by 35 U.S.C. 119(b).

## Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 4. Claim1, 13 and 14 are rejected under 35 U.S.C. 102(e) as being anticipated by U.S. Patent 6,173,395 to Wisor et al, hereafter referred to as Wisor.

#### Regarding claim 1:

Wisor teaches:

- a method for tracing the execution path of a computer program comprising at least one module including a plurality of instructions ("to enable the user to trace the sequence of execution of instructions..." in col. 3 lines 1-2)

Application/Control Number: 09/682,520 Page 3

Art Unit: 2124

- at least one of said instructions being a branch instruction ("The stored data identifies whether or not certain branches in the test program were taken..." in col. 4 lines 58-59)

- identifying each branch instruction ("involves detecting the branch instructions..." in col. 6 lines 16-17)
- evaluating each branch instruction to be one of true and false, and responsive to an evaluation of true, pushing a unique identifier into a predefined area of storage, wherein said unique identifier is associated with the instructions executed as a result of said evaluation of true ("When a test program is executed, a trace record is generated and stored in the BTHB (branch trace history buffer)...the bitmap entries are generated for a series of conditional branches and contain individual bits which represent the taken or not-taken status of the branches" in col. 3 lines 11-21.)

substantially as claimed.

#### Regarding claim 13 and 14:

Claims 13 and 14 are directed a an apparatus and method for performing the method of claim 1, and are rejected for the reasons set forth in connection with claim 1.

## Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 2124

6. Claims 2 and 3 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent

6,173,395 to Wisor et al, hereafter referred to as Wisor.

Regarding claim 2:

The rejection of claim 1 is incorporated, and further, Wisor discloses providing the predefined area

of storage with memory (Note Figure 1, item 30). Wisor does not explicitly disclose the memory as

being volatile memory. Official Notice is taken that at the time the invention was made, the use of

volatile memory was well known to one of ordinary skill in the art. As such, one of ordinary skill in

the art at the time the invention was made would choose to utilize volatile memory for the system

disclosed by Wisor for the purposes of freeing memory space when the computer is powered down

and no longer in use.

Regarding claim 3:

The rejection of claim 1 is incorporated, and further, Wisor discloses providing the predefined area

of storage with memory (Note Figure 1, item 30). Wisor does not explicitly disclose the memory as

being non-volatile memory. Official Notice is taken that at the time the invention was made, the use

of non-volatile memory was well known to one of ordinary skill in the art. As such, one of ordinary

skill in the art at the time the invention was made would choose to utilize non-volatile memory for

the system disclosed by Wisor for the purposes of retaining information in memory when the

computer is powered down and no longer in use.

Page 4

Application/Control Number: 09/682,520 Page 5

Art Unit: 2124

7. Claims 4-12 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S.

Patent 6,173,395 to Wisor et al, hereafter referred to as Wisor in view of U.S. Patent 6,353,924 to

Ayers et al, hereafter referred to as Ayers.

Regarding claim 4:

The rejection of claim 1 is incorporated, and further, Wisor discloses outputting the contents of the

storage area at a predetermined point in time ("the contents of the BTHB and the test code are

retrieved into the test station" in col. 3 lines 22-24). Wisor does not explicitly disclose outputting the

contents to a file. Ayers discloses in an analogous trace recording system outputting trace sequence

information to a file as claimed ("The sequence information can be recorded...to a disk file" in col.

3 lines 60-61). It would have been obvious to one of ordinary skill in the art at the time the

invention was made to use the file saving capabilities of Ayers with the trace recording system of

Wisor, as this would enable a user to archive tracing records in the system disclosed by Wisor.

Regarding claim 5:

The rejection of claim 4 is incorporated, and further, Wisor discloses outputting the trace

information upon exit from at least one module as claimed ("After a program is executed on the

system under test, the contents of the BTHB are retrieved into the computer system" in col. 9 lines

11-12)

Regarding claim 6:

The rejection of claim 5 is incorporated, and further, Wisor discloses outputting the contents of the

storage area at the same time as the exit trace information as claimed ("After a program is executed

Art Unit: 2124

on the system under test, the contents of the BTHB are retrieved into the computer system" in col.

Page 6

9 lines 11-12)

Regarding claim 7:

The rejection of claim 4 is incorporated, and further, Wisor discloses determining whether the storage area is full, and responsive to a positive determination, outputting the contents as claimed

("Tracing can be set to stop...when the BTHB is full" in col. 8 lines 34-35)

Regarding claim 8:

The rejection of claim 4 is incorporated, and further, Wisor does not explicitly disclose determining

whether a failure has occurred within the program, and responsive to a positive determination,

outputting the contents to a file. Ayers discloses in an analogous trace recording system determining

whether a failure has occurred and outputting the contents to a file as claimed ("upon some

triggering event such as a system crash, the post-processor writes out the sequence record..." in col.

9 lines 65-67). It would have been obvious to one of ordinary skill in the art at the time the

invention was made to use the failure-responsive outputting capabilities of Ayers with the trace

recording system of Wisor, as this would enable a user to obtain the exact sequence of instructions

that executed prior to a crash in the system disclosed by Wisor as stated in col. 2 lines 21-27 of

Ayers.

Regarding claim 9:

The rejection of claim 4 is incorporated, and further, Wisor discloses determining whether the

predefined area of storage is full, and overwriting the first unique identifier in the storage area as

Art Unit: 2124

claimed ("The buffer can be set to wrap around so that the oldest entries are overwritten by the newest entries..." in col. 8 lines 35-37)

#### Regarding claim 10:

The rejection of claim 9 is incorporated, and further, Wisor discloses writing the position of the most recent unique identifier to be written out to the storage area to the storage area as claimed ("When a conditional branch is found, a counter is incremented..." in col. 9 lines 57-58. The counter represents the position.)

### Regarding claim 11:

The rejection of claim 10 is incorporated, and further, Wisor discloses using the position to determine number of unique identifiers that have been overwritten as claimed ("the BTHB contents are checked to determine whether the number of bits...matches the corresponding number of conditional branches in the instruction sequence" in col. 9 lines 18-21)

#### Regarding claim 12:

The rejection of claim 11 is incorporated, and further, Wisor does not explicitly disclose increasing the size of the predefined area of storage. Ayers discloses in an analogous trace recording system increasing the size of the predefined area of storage as claimed ("The buffer size limits the amount of traceback history...Preferably this limit can be set dynamically..." in col. 6 lines 26-28). It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the size-increasing capabilities of Ayers with the trace recording system of Wisor, as this would enable a user to obtain a larger amount of traceback history in the system disclosed by Wisor.

Application/Control Number: 09/682,520 Page 8

Art Unit: 2124

Regarding claim 15:

source code to be executed and subsequently traced.

Claim 15 recites a compiler for performing the method of claim 1, and is rejected for the reasons set forth in connection with claim 1. For the added limitation of a compiler, Wisor does not explicitly disclose a compiler. Ayers discloses in an analogous trace recording system a compiler for instrumenting a computer program as claimed (Note Figure 4, items 311 and 313 and the corresponding sections of the disclosure). It would have been obvious to one of ordinary skill in the art at the time the invention was made to use a compiler in the system of Wisor, as this would enable

Conclusion

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Trent J Roche whose telephone number is (703)305-4627. The examiner can normally be reached on Monday - Friday, 9:00 am - 6:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kakali Chaki can be reached on (703)305-9662. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
